

Amendments to the Claims

1 Claim 1 (currently amended): A computer-implemented method of programmatically building
2 queries, comprising ~~steps of~~:

3 programmatically building a query user interface to query a content source, wherein the
4 query user interface comprises a plurality of query parameters, each query parameter comprising a
5 unique query parameter name, a query qualifier, and a query parameter value, further comprising:

6 dynamically identifying the content source to be queried;

7 programmatically determining a plurality of content values specified in the
8 dynamically-identified content source;

9 programmatically determining, based on the specified content values, a plurality of
10 content types corresponding thereto;

11 using at least one of the programmatically-determined content types to consult a
12 lookup component to obtain at least two query parameter names usable to query the content
13 source;

14 programmatically identifying, for each of the obtained query parameter names, at
15 least one query qualifier corresponding thereto, each query qualifier usable in determining a match
16 when comparing selected ones of the content values to that query parameter name;

17 programmatically identifying, for each ~~at least one~~ of the obtained query parameter
18 names, at least one value usable therewith as a query parameter value;

19 programmatically building the plurality of query parameters by associating, with
20 each of the obtained query parameter names, each of the at least one programmatically-identified
21 ~~at least one~~ query qualifiers ~~qualifier~~ corresponding thereto and each of the at least one

programmatically-identified-at least one value values usable therewith as a query parameter value,
if any; and

displaying on the query user interface, for each of the programmatically-built query
parameters, the obtained query parameter name, a first selector usable to select one of the at least
one query qualifiers ~~corresponding thereto~~ associated therewith, and a second selector usable to
select at least one of the at least one values associated ~~usable therewith, if any, or for providing at~~
~~least one user-entered value usable therewith~~; and

enabling a user to build a query command to query the content source by using, for each
of at least one of the displayed query parameter names, the first selector to select one of the
associated query qualifiers and using the second selector to select ~~at least one of: (1) at least one~~
~~of the associated values, if any, or (2) at least one user-entered value.~~

Claim 2 (canceled)

Claim 3 (currently amended): The method according to Claim 1, wherein the using [[step]] at
least one of the programmatically-determined content types further comprises using information
regarding the user when consulting the lookup component.

Claim 4 (currently amended): The method according to Claim 1, further comprising ~~the step of~~:
programmatically identifying at least one query extension parameter for the query
command, responsive to a request from the user to extend the display on the query user interface,
further comprising, for each of the at least one query extension parameters:

5 using at least one of the obtained query parameter names to obtain a related query
6 parameter name;
7 programmatically identifying at least one query qualifier corresponding to the
8 obtained related query parameter name, each query qualifier usable in determining a match when
9 comparing selected ones of the content values to the obtained related query parameter name; and
10 programmatically building the query extension parameter by associating, with the
11 obtained related query parameter name, the programmatically-identified at least one query
12 qualifier corresponding thereto; and
13 wherein the displaying [[step]] further comprises also displaying each of the at least one
14 programmatically-identified query extension parameters as additional ones of the
15 programmatically-built query parameters.

Claim 5 (canceled)

1 Claim 6 (currently amended): The method according to Claim 1, wherein the using [[step]] at
2 least one of the programmatically-determined content types further comprises using information
3 regarding the content source when consulting the lookup component.

1 Claim 7 (previously presented): The method according to Claim 3, wherein the information
2 regarding the user comprises at least one of: a role of the user, preferences of the user, a device
3 used by the user, or an identification of the user.

Claims 8 - 23 (canceled)

Claim 24 (currently amended): A computer-implemented system configured to programmatically build queries, comprising:

a computer comprising a processor; and

instructions which execute using the processor to implement functions comprising:

~~means for~~ programmatically building a query user interface to query a content source, wherein the query user interface comprises a plurality of query parameters, each query parameter comprising a unique query parameter name, a query qualifier, and a query parameter value, further comprising:

~~means for~~ dynamically identifying the content source to be queried;

~~means for~~ programmatically determining a plurality of content values specified in the dynamically-identified content source;

~~means for~~ programmatically determining, based on the specified content values, a plurality of content types corresponding thereto;

~~means for~~ using at least one of the programmatically-determined content types to consult a lookup component to obtain at least two query parameter names usable to query the content source;

~~means for~~ programmatically identifying, for each of the obtained query parameter names, at least one query qualifier corresponding thereto, each query qualifier usable in determining a match when comparing selected ones of the content values to that query parameter name;

~~means for~~ programmatically identifying, for ~~each~~ ~~at least one~~ of the
obtained query parameter names, at least one value usable therewith as a query parameter value;

~~means for~~ programmatically building the plurality of query parameters by
associating, with each of the obtained query parameter names, ~~each of the~~ ~~at least one~~
programmatically-identified ~~at least one~~ query ~~qualifier~~ qualifiers corresponding thereto and ~~each~~
~~of the~~ ~~at least one~~ programmatically-identified ~~at least one value~~ values usable therewith ~~as a~~
~~query parameter value, if any; and~~

~~means for~~ displaying on the query user interface, for each of the
programmatically-built query parameters, the obtained query parameter name, a first selector
usable to select one of the at least one query ~~qualifiers corresponding thereto~~ associated
therewith, and a second selector usable to select at least one of the at least one values ~~usable~~
associated therewith, ~~if any, or for providing at least one user-entered value usable therewith; and~~

~~means for~~ enabling a user to build a query command to query the content source
by using, for each of at least one of the displayed query parameter names, the first selector to
select one of the associated query qualifiers and using the second selector to select ~~at least one of:~~
(1) at least one of the associated values, if any, or (2) at least one user-entered value.

Claim 25 (currently amended): A computer program product configured to programmatically
build queries, the computer program product embodied on one or more computer-readable
storage media and comprising computer-readable program code for:

~~computer-readable program code for~~ programmatically building a query user interface to
query a content source, wherein the query user interface comprises a plurality of query

parameters, each query parameter comprising a unique query parameter name, a query qualifier, and a query parameter value, further comprising computer-usable program code for:

~~computer-readable program code for~~ dynamically identifying the content source to be queried;

~~computer-readable program code for~~ programmatically determining a plurality of content values specified in the dynamically-identified content source;

programmatically determining, based on the specified content values, a plurality of content types corresponding thereto;

~~computer-readable program code for~~ using at least one of the programmatically-determined content types to consult a lookup component to obtain at least two query parameter names usable to query the content source;

~~computer-readable program code for~~ programmatically identifying, for each of the obtained query parameter names, at least one query qualifier corresponding thereto, each query qualifier usable in determining a match when comparing selected ones of the content values to that query parameter name;

~~computer-readable program code for~~ programmatically identifying, for each at ~~least one~~ of the obtained query parameter names, at least one value usable therewith as a query parameter value;

~~computer-readable program code for~~ programmatically building the plurality of query parameters by associating, with each of the obtained query parameter names, each of the at least one programmatically-identified ~~at least one~~ query ~~qualifier~~ qualifiers corresponding thereto and each of the at least one programmatically-identified ~~at least one value~~ values usable therewith

28 as a query parameter value, if any; and
29 ~~computer-readable program code for displaying on the query user interface, for~~
30 each of the programmatically-built query parameters, the obtained query parameter name, a first
31 selector usable to select one of the at least one query qualifiers ~~corresponding thereto~~ associated
32 therewith, and a second selector usable to select at least one of the at least one values ~~usable~~
33 associated therewith, if any, ~~or for providing at least one user-entered value usable therewith; and~~
34 ~~computer-readable program code for enabling a user to build a query command to query~~
35 the content source by using, for each of at least one of the displayed query parameter names, the
36 first selector to select one of the associated query qualifiers and using the second selector to select
37 ~~at least one of: (1) at least one of the associated values, if any, or (2) at least one user-entered~~
38 ~~value.~~
